Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues.

Claim 49; Page 32; 102pp; English.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGPD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a

```
peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis.

To cyclisation are used to interfere with angiogenesis.

C characterised by angiogenesis, neovascularisation or lymphangiogenesis.

C The condition is diabetic retinopathy pooriasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive correlated angiogenic dysfunction, diabetes induced neovascular sequelae, nymportenaion induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition characterised by fluid accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to indeptides are used to interfere with at least one biological activity induced by VEGF, VEGF-C or -D and contains and proposition of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of the contains of

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human USCFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-corporate of producing a monomeric monocyclic peptide by a measuring beta-corporate loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior peptides) and a cyclic peptide with at least one amino acid deleted prior cyclisation are used to interfere with angiogenesis, necessation or lymphangiogenesis, re also used to modulate vascular permeability or brain. The peptides are also used to modulate vascular permeability or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic or brain. The peptides are used to image blood vessels and lymphatic or brain are least one biological activity induced by VECF. Coreb and are also used in combination with an anti-inflammatory agent, to treat a corporation or periodes are inflammatory agent, to treat a corporation or preservable or the peptides or the peptides 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                    sequence represents a monomeric monocyclic peptide of the invention,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human, VEGF, vascular endothelial growth factor; angiogenesis; neovascularisation; lymphangiogenesis; psoriasis; tumour; diabetes induced neovascular sequelae; rheumatoid arthritis; diabetic retinopathy; chronic inflammation; cyclic.

to cyclisation are used to interfere with anglogenesis.

The condition are used to interfere with anglogenesis.

The condition is diabetic retinopathy, psoriasis, arthropathy, the condition is diabetic retinopathy, psoriasis, arthropathy, the condition is diabetic retinopathy, psoriasis, arthropathy, the condition is diabetic retinopathy, psoriasis, arthropathy, the mangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angloplasity restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive normone-related anglogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability accumulation in peripheral limbs or in lungs, peritoneal cavity, pleura, or brain. The peptides are used to inage blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VEGF, VEGF, or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ;

                                                                                                                                                                                                                                                                                The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human VEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring betabeta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior
                                                                                                                         Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine residues.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           ö

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human CC Whose 3-dimensional structure is modelled on the expose loop of human composed to the invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-ce beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior corpitation are used to interfere with angiogenesis.

CC cyclisation are used to interfere with angiogenesis.

CC corditation are used to interfere with angiogenesis.

CC dearacterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC characterised by angiogenesis, neovascularisation or host-recovery

CC crebrovascular accident, post-angioplasty restenosis, head, heat or cold creaman, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability accumulation in peripheral limbs or in lungs, peritoned cavity, pleura, or brain. The peptides are used to image blood vessels and lymphatic creamal accountation with at least one biological activity induced by VEGF, VEGF-C or p and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, when an anti-inflammatory agent, to treat a chronic inflammation with an anti-inflammatory agent, to treat a chronic inflament on the peptides are used to induce the control of the control of the control o
                                                                                                                                                                                                                                                                                                                                              Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine

```
Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine
diabetes induced neovascular sequelae, rheumatoid arthritis;
diabetic retinopathy; chronic inflammation; cyclic.

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human vEGFD (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cycleine residues. The monocyclic peptides index a cyclis peptide with at least one amino acid deleted prior to cyclisation are used to interfere with angiogenesis.

The condition is diabetic retinopathy, paoriasis, arthropathy, hear or changiona, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascular sequelae, head, heat or cold trauma, substance-induced neovascular sequelae, nor hear or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition diabete sinduced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability in a mammal (the mammal has a condition diabete liver) peritoned leavity, pleura, accumulation in peripheral links or in lungs, peritonal captured.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              or brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity induced by VBGF. VBGF-C or -D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           85.2%;

The sequence represents a monomeric monocyclic peptide of the invention, whose 3-dimensional structure is modelled on the expose loop of human whose 3-dimensional structure is modelled on the expose loop of human vectod (vascular endothelial growth factor). The invention relates to a method of producing a monomeric monocyclic peptide by a measuring beta-concern of producing a monomeric monocyclic peptide loop fragment from an exposed loop of a growth factor protein and peptide loop fragment from an exposed loop of a growth factor protein and cyclic peptides with at least one amino acid deleted prior peptides, and a cyclic peptide with at least one amino acid deleted prior corpitation are used to interfere with angiogenesis.

CC cyclisation are used to interfere with angiogenesis.

CC cyclisation are used to interfere with angiogenesis.

CC corpitation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation or lymphangiogenesis.

CC cromarisation or lymphangiogenesis in a mammal with a condition characterised by angiogenesis, neovascularisation of the liver. excessive hemmangioma, vascular accident, post-angioplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver. excessive corpused angiogenic dysfunction, diabetes induced neovascular sequelae, hypertension induced neovascular sequelae, or chronic liver infection. The peptides are also used to modulate vascular permeability corbrain. The peptides are used to image blood vessels and lymphatic crace brain. The peptides are used to image blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere crace with at least one biological activity induced by VEGF, VEGF-C or D and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially rheumatoid arthritis, psoriasis and ä Novel monomeric monocyclic peptide, used to interfere with angiogenesis, or lymphangiogenesis, is produced by cyclizing a peptide loop fragment from an exposed loop of a growth factor protein by oxidizing the cysteine Claim 49; Page 32; 102pp; English. diabetic retinopathy Sequence 10 AA; residues.

andiogenesis, necvascularisation or lymphangiogenesis. The condition is diabetic retinopathy, psoriasis, arthropathy, hemangioma, vascularised malignant or benign tumour, post-recovery cerebrovascular accident, post-recovery cerebrovascular accident, post-amignant or benign tumour, post-recovery cerebrovascular accident, post-amignoplasty restenosis, head, heat or cold trauma, substance-induced neovascularisation of the liver, excessive hormone-related angiogenic dystunction, diabetees induced neovascular sequelae, hypertenation induced neovascular sequelae, hypertenation induced neovascular sequelae, hypertenation induced neovascular sequelae, hypertenation induced neovascular sequelae, hypertenation induced neovascular sequelae, hypertenation induced induced by periodes are used to inage blood vessels and lymphatic vasculature. The monomeric and bicyclic peptides are used to interfere with at least one biological activity pleution and are also used in combination with an anti-inflammatory agent, to treat a chronic inflammation, especially renumatoid arthritis, psoriasis and diabetic retinopathy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequence represents Human VEGP-D (vascular endothelial growth factor) amino acids Val101-PRO186. The sequence is used in a method of producing a monomeric monocyclic peptide by a measuring beta-beta carbon separation distances on opposite antiparallel strands of a peptide loop fragment from an exposed loop of a growth factor protein and cyclising the peptide by oxidising the cysteine residues. The monocyclic peptides, dimeric bicyclic peptides (comprising 2 linked monocyclic peptides) and a cyclic peptide with at least one amino acid deleted prior to cyclisation are used to interfere with anglogenesis, neovascularisation or lymphangiogenesis in a mammal with a condition characterised by
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 rel monomeric monocyclic peptide, used to interfere with angiogenesis, lymphangiogenesis, is produced by cyclizing a peptide loop fragment om an exposed loop of a growth factor protein by oxidizing the cysteine

Stacker S,

```
The present sequence represents human vascular endothelial growth factor (VEGF). The specification describes a human cell line which stably expresses VEGF-D, or fragments/analogues having VEGF-D biological activity. VEGF-D antagonists, e.g. antisense nucleic acids or triplex or seful for the treatment or alleviation of malignant melanomas, tumnours or psoriasis. Angiogenesis and lymphangiogenesis stimulating amounts of VEGF-D can be administered to enhance the acceptance and/or healing of skin grafts or to stimulate the healing of a surgical or traumatic wound to the skin. Lymphangiogenesis stimulating amounts of to treat lymphadema. Endothelial proliferation stimulating amounts of VEGF-D can be used to treat scleroderma. Vascularisation stimulating amounts of VEGF-D can be used to treat anhydrotic ectodermal dysplasia. VEGF-D antibodies are useful for detecting tumours expressing VEGF-D. Fully-chosen from endothelial cell proliferation, migration, survival and differentiation and lymphangiogenesis without inducing vascular
                                                                                                                                                                                                                                                                                                                  Vascular endothelial growth factor; VEGF, VEGF-D; malignant melanoma; tumour; psoriasis; angiogenesis; lymphangiogenesis; skin graft; wound healing; lymphedema; scleroderma; anhydrotic ectodermal dysplasia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       A human cell line stably expressing vascular endothelial growth factor useful for treating melanomas or tumors expressing VEGF-D.

This sequence represents a 109 amino acid truncated human VEGF-D (vascular endothalial growth factor D), lacking both the N- and C-terminal regions. The invention relates to a monoclonal antibody, or fragments thereof, which is specifically reactive with the truncated human VEGF-D, and methods of preparing the antibody. The antibody of the invention interfers with the binding of VEGF-D to the VEGF receptors VEGR-2 and VEGR-3, but does not interfers with the binding of VEGF-D to these receptors and additionally is not reactive with VEGF-C. The these receptors and additionally is not reactive with VEGF-C. The carticoly may be used to treat disorders associated with vascular permeability, endothelial cell proliferation, angiogenesis, lymphangiogenesis, neovascularisation and endothelial cell for inventional cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial factorial cell factorial modifical cell factorial factorial cell factorial cell factorial modifical cell factorial cell factorial modifical cell factorial cell factorial modifical cell factorial cell factorial modifical cell factorial cell factorial modifical cell factorial cell factorial modifical cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial cell factorial

This invention describes a novel single-chain dimeric polypeptide which binds to extracellular ligand-binding domain of vascular endothelial growth factor (VEGF) type 2 receptor (KDF) or VEGF type 3 receptor (Flt-4). The polypeptide of the invention compises two receptor-binding sites of which one is incapable of binding to a ligand-binding domain of the receptor, and one is incapable of effectively binding to a ligand-binding domain of the receptor, wand at least one monomer of the dimeric polypeptide is derived from VEGF, VEGF-C or VEGF-D, where the polypeptide is capable of binding to the receptor, but incapable of activating the receptor. The polypeptide of the invention is useful for preparing a medicament for preventing or treating a disease or condition involving increased signal transduction from, or an increased activation of a VEGF crope 2 or type 2 receptor e.g. for inhibiting anglogenesis or type 2 or type 2 represents a human single-chain VEGF-D monomer which can be modified and used in the construction of a VEGF-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel single-chain dimeric polypeptide for inhibiting angiogenesis, bi to extracellular ligand-binding domain of vascular endothelial growth factor type 2/type 3 receptor but does not activate the receptor.
                                                                                                                                                                                                                                                                                                                                                                                                              <u>-</u>6

This invention describes a novel single-chain dimeric polypeptide which binds to extracellular ligand-binding domain of vascular endothelial growth factor (WEGF) type 2 receptor (KDR) or VEGF type 3 receptor-binding sites of which one is capable of binding to a ligand-binding domain of the receptor, and at least one monomer of the dimeric domain of the receptor, and at least one monomer of the dimeric polypeptide of the invention is useful for preparing a receptor. The polypeptide of the invention is useful for preparing a medicament for preventing or treating a disease or condition involving increased signal transduction from, or an increased activation of a VEGF or type 2 or type 3 receptor e.g. for inhibiting anglogenesis or monomer unit used in the construction of a VEGF-D dimer described in the monomer unit used in the construction of a VEGF-D dimer described in the construction. In one instance a polypeptide is claimed comprising a first monomer derived from VEGF-D having at least one mutation selected from the group consisting of 100 NJR, TJSR, FJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, RJSR, 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
Novel single-chain dimeric polypeptide for inhibiting angiogenesis, bi to extracellular ligand-binding domain of vascular endothelial growth factor type 2/type 3 receptor but does not activate the receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

The invention Fractes to a mectual soft administering to a cell bearing the receptor an active amount of a comprising administering to a cell bearing the receptor an active amount of a composition comprising a polypeptide having at least 90%, preferably 95%, sequence identity with the mouse VEGF-D polypeptide or its fragment. The polypeptide identity with the mouse VEGF-D polypeptide or its fragment. The polypeptide is pecifically activates VEGF receptor-3 which results in proliferation of ymph vessel endothelial cells. The polypeptide is useful for activating only VEGF receptor-3 and is therefore useful for stimulating of proliferation and/or maintaining of only lymph vessel endothelial cells. The polypeptide is also useful in the diagnosis of a neoplastic disease characterized by an increase in lymph vessel endothelial cells. The mouse VEGF-D has two isoforms. The longer amino acid sequence designated mVEGF-D (Compared to the shorter isoform mVEGF-D2, which diverges after residue 112. The present sequence is that of the VEGF-DDGF homology domain (VHD), compared residues 92-201 of the full length mouse VEGF-D2 protien of
                                                                   Specific activating of VEGF receptor-3, useful for stimulating proliferation and/or maintaining of only lymph vessel endothelial cells, by administration of a polypeptide having high sequence identity with the mouse VEGF-D polypeptide.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Growth factor; human; dimer; cysteine knot; cellular inclusion body;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Preparing active growth factor dimers from inclusion bodies in high yield.
                                                                                                                                                                                            invention relates to a method for activating only vascular
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Human growth factor protein fragment FIGF178 (VEGF-D178).

This site is the end of the protein sequence represented in SDQ ID 1 of the Sequence listing"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       human; endothelial growth factor; cytostatic; cancer; angiogenesis;
                          This invention describes the novel preparation of biologically active dimers of recombinant human growth factors of the cysteine knot family starting from cellular inclusion bodies. Such dimers are are useful in pharmaceutical compositions and the method provides yields of 31-39.7% in examples, compared with about 10% for the conventional method (see Biochemistry, 28 (1989) 2956). AAY08278-Y08301 are human growth factor protein fragments used in the method of the invention
                                                                                                                                                                                                                            Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  cell proliferation; revascularisation; amputation; vasculogeneais; transplant; brain; breast; intestine; kidney; lung; ovary; pancreas; prostate; uterus; gene therapy.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      This invention describes a novel human endothelial growth factor polypeptide which has cytostatic activity. The polypeptide and its encoding polynucleotide are useful in the diagnosis, prevention, and treatment of cancer and other conditions or diseases involving

angiogenesis and cell proliferation. NVR may also be used to

```
revascularisation following traumatic amputation and surgical product reconstruction or added to a tissue culture to promote vasculogenesis in tissues for autologous or heterologous transplant. Antagonists or inhibitors of NVR may be used to suppress or prevent angiogenesis and thus prevent the growth and development of cancers such as cancer of the brain, breast, intestine, kidney, lung, ovary, paroreas products of the uterus. The products of the invention can be used for gene therapy. This sequence represents the human NVR protein described in the disclosure of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              g
```

The sequence is that of mouse lung vascular endothelial growth factor D2

Claim 16; Page 64-65; 101pp; English.

New isolated vascular endothelial growth factor-D - used to develop products for use in e.g. modifying angiogenesis or treating lung, heart or intestinal disorders.

Stacker SA, Alitalo K;

N-PSDB; AAV20809

```
(VEGF-D2). VEGF-D2 can be used for e.g. acceleration of angiogenesis in wound healing, tissue or organ transplantation, or to establish collateral circulation in tissue infarction or arterial stenosis, such as coronary artery disease, and inhibition of angiogenesis in the treatment of lung disease, and inhibition of angiogenesis in the treatment of thus disease, to improve blood circulation in the lung treatment of lung disease, to improve blood circulation in the lung and/or assess exchange between the lungs and the blood stream or to improve blood circulation to the heart and 02 gas permeability in cases of cardiac insufficiency, to improve blood flow and gaseous exchange in chronic obstructive airway disease, or to treat malabsorptive syndromes in the intestinal tract. Quantitation of VEGF-D in cancer bloops, specimens may be useful as an indicator of fluture metastatic risk. Antagonists can be used for treating accomditions such as congestive heart failure, involving accumulations of fluid in the lung resulting from increases in viscular permeability. The products can also be used
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö

Patent No. US20020065218A1

GENERAL INFORMATION:

APPLICANT: ACHEN, Marc

APPLICANT: HUGHES, Richard

APPLICANT: CENDRON, Angela

TITLE OF INVENTION: VEGF-D/VEGF-C/VEGF PEPTIDOMIMETIC INHIBITOR

FILE REFERENCE: 1064/48505 Achen et al

CURRENT APPLICATION NUMBER: US/09/761,636A

CURRENT APPLICATION NUMBER: US 60/176,293

PRIOR PILING DATE: 2000-01-18

Sequence 6, Application US/09847524

Patent No. 6689352

GENERAL INFORMATION:

APPLICANT: ACHEN, Marc G

TITLE OF INVENTION: GROWTH FACTOR RECEPTOR-3 AND USES THEREOF

TITLE OF INVENTION UNMER: US/09/847,524

CURRENT APPLICATION NUMBER: US/09/847,524

CURRENT FILING DATE: 2001-05-03

NUMBER OF SEQ ID NOS: 6

SOFTWARE: PATENTIN VET. 2.0
                                                                                                                                                                                                                                                                                     Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                ö

SEQUENCE DESCRIPTION: SEQ ID NO: 3:
INFORMATION FOR ESQ ID NO: 3:
SEQUENCE CHARACTERISTICS:
LENGTH: 325 amino acide
TYPE: amino acide
STRANDEDNESS: single
TOPOLOGY: linear
MOLECULE TYPE: protein
HYPOTHETICLE: NO

                                                                                                                                                                                                                                                                                                                                                                                                                                                    Colon, and pancreas.

PTM: Undergoes a complex proteolytic maturation which generates a variety of processed secreted forms with increased activity toward VEGFR-3 and VEGFR-2 VEGF-D first form an antiparallel homodimer linked by disulfide bonds before secretion. The fully processed VEGF-D is composed mostly of two VEGF homology domains (VHDs) bound by non-covalent interactions.

SIMILARITY: Belongs to the PDGF/VEGF growth factor family.
                                                                                                                                                                                                                                                                                  PROCESSING, AND SEQUENCE OF 89-94; 100-105 AND 206-213.

SEQUENCE FROM N.A.

RA Submitted (JUL-1997) to the EMBL/GenBank/DDBJ databases.

- I- FUNCTION: Growth factor active in angiogenesis, lymphangiogenesis and endothelial cell growth, stimulating their proliferation and migration and also has effects on the permeability of blood wssels. May function in the formation of the venous and lymphatic vessels. May function in the formation of the venous and lymphatic vascular systems during embryogenesis, and also in the maintenance of differentiated lymphatic endothelium in adults. Binds and activates VEGFR-3 (Flt4) receptor (By similarity).

--- SUBUNIT: Homodimer; non-covalent and antiparallel (By similarity).

--- SUBCLLUIAR LOCATION: Secreted (By similarity).

--- SUBCLLUIAR LOCATION: Secreted forms with increased activity toward veriety of processed secreted forms with increased activity toward veriety of processed secreted forms with increased activity toward veriety of processed mostly of two VEGF homology domains (VHDs) cound by disulfide bonds before secretion. The fully processed veriety bound by non-covalent interactions (By similarity).

--- SIMILARITY: Belongs to the PDGF/VGGF growth factor family.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

US-09-847-524-6

US-09-847-524-6

Sequence 6, Application US/09847524

Patent No. 6689352

GENERAL INFORMATION:
APPLICANT: ACHEN, MARC G

TITLE OF INVENTION: A METHOD FOR ACTIVATING ONLY THE VASCULAR ENDOTHELIAL

TITLE OF INVENTION: A METHOD FOR ACTIVATING ONLY THE VASCULAR ENDOTHELIAL

TITLE OF INVENTION: GROWNTH FACTOR RECEPTOR-3 AND USES THEREOF

CURRENT APPLICATION NUMBER: US/09/847,524

CURRENT FILING DATE: 201-05-03

NUMBER OF SEQ ID NOS: 6

SOFTWARE: PATENTIN VOY: 2.0
                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

A;Title: A novel species of cytochrome P-450 (P-450-ib) specific for the small intestine
A;Reference number: A40938; MUID:92011499; PMID:1717443
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      L-aspartate oxidase-like protein - Arabidopsis thaliana
N;Alternate names: protein T9L3_60
C;Species: Arabidopsis thaliana (mouse-ear cress)
C;Bacies: Arabidopsis thaliana (mouse-ear cress)
C;Accession: T51421
R;Sato, S.; Nakamura, Y.; Kaneko, T.; Kato, T.; Asamizu, E.; Kotani, H.; Tabata, S.; Mewe
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A;Molecule type: mRNA

Vascular endothelial growth factor-1 precursor - mouse
C;Species: Mus musculus (house mouse)
C;Species: Mus musculus (house mouse)
C;Accession: B44881, A43351, A61029
R;Breier, G.; Albrecht, U.; Sterrer, S.; Risau, W.
Development 114, 521-532, 1992
A;Title: Expression of vascular endothelial growth factor during embryonic angiogenesis & A;Reference number: A44881; MUID:92274860; PMID:1592003
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 A; Residues: 1-190 <a href="https://doi.org/10.00731">https://doi.org/10.00731</a>; Residues: 1-190 <a href="https://doi.org/10.00731">https://doi.org/10.00731</a>; References: UNIPROT.000731; GB:S38083; NID:g249858; PIDN:AAB22253.1; PID:g249859
